

RABIH SIDDIQUI

San Jose, CA | (669) 251-5658 | rabihzsiddiqui@gmail.com | rabih.app | github.com/rabihzsiddiqui | US Citizen

EDUCATION

University of California, San Diego

Bachelor of Science, Cognitive Science

Graduated 2024

San Diego, CA

Coursework: Data Science in Practice, Computational Thinking, Statistical Analysis, Research Methods, Cognitive Consequences of Technology

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, HTML, CSS, GLSL, Java, R

Frameworks and Libraries: React, Next.js, Three.js, Tailwind CSS, Dexie.js, pandas

AI Tools: Claude Code, Cursor, OpenAI Codex, Stitch, Antigravity

Developer Tools: Git, VS Code, Vite, Vitest, Vercel, Figma, ESP-IDF

Focus Areas: Front-end development, AI-assisted development, UX research, prompt engineering, WCAG accessibility, progressive web apps

AI-ASSISTED DEVELOPMENT

- Shipped 12 projects on my own. Browser tools, two games, and a hardware companion device.
- Write the build out as a list of prompts before starting. Project rules and handoff notes live in a CLAUDE.md file, so each session starts where the last one stopped.
- Test every build by hand. Claude Code introduces bugs and drifts from the design, and both need catching before anything ships.
- Wrote Vitest unit tests for scReen and a headless script for swoRd-Runner that checks about 30 gameplay rules.

PROJECTS

Nyra, AI Fairy Companion Device

Three.js, GLSL, WebSockets, ESP32-S3, ESP-IDF, Vite

In development

2026

- Built the fairy in Three.js and GLSL with four animation states, reflected above the device as a Pepper's Ghost hologram.
- Runs on an ESP32-S3 board. The persona is terse and holds spoken replies near 40 words.
- Wrote a WebSocket server into the firmware to broadcast state to the visual, with socket work kept off the audio task and connections capped at three.
- The device screen shows dialogue only, which freed 7.6 MB of flash. Every state carries three visual signals, so color is never the only cue.

nuRa, Local-First Symptom Tracker

TypeScript, React, Next.js, Tailwind CSS, Dexie.js, IndexedDB

Shipped

2026

- Logs a symptom, severity, and a note in three taps, then lays them out by day and month. Installable and works offline.
- Everything stays in IndexedDB on the device. No account, no backend.
- Severity reads through shape and luminance instead of red and green, which keeps it usable with color vision deficiency.

Tactical RPG, Browser Grid Tactics Game

JavaScript, Three.js, GLSL

In development

2026

- Fire Emblem style tactics in the browser. Six units a side, a weapon triangle, hit and crit rolls, level ups, and enemy AI that charges or holds.
- Low-poly units render through a perspective camera, then get downsampled and upscaled with nearest-neighbour filtering and a palette shader for a 3DS look.
- Splitting the single-file build into modules, with combat returning typed events the renderer plays back, which keeps game logic out of render code.

Also on rabih.app: spectRa (color vision simulator), compResso (in-browser video compression), scReen (display size comparator), swoRd-Runner (endless runner), plus five more.

TESTING AND RESEARCH EXPERIENCE

Trusted Tester, Google

September 2021 to Present | Sunnyvale, CA

- Test pre-release Google hardware and software before public launch. Completed 70+ feedback surveys and joined two product review calls with UX Researchers.

User Research Participant, Google

November 2023 to Present | Mountain View, CA

- Brought in for paid research sessions on upcoming Google products. Evaluate prototypes and share usability feedback with UX teams.

User Research Participant, Meta Reality Labs

March 2025 to Present | Burlingame, CA

- Paid research studies on upcoming Meta Quest features. Invited to Meta's AR/VR User Research Community based on my feedback.

VR Prototype QA, KIWI design

December 2020 to August 2024 | Freelance, Remote

- Tested 15 VR accessory prototypes over nearly four years with R&D and product teams, across several development cycles.
